EMMANUEL L. MOISE
SUPERVISORY PATENT EXAMINER

Allowable Subject Matter

All pending claims have been deemed allowable over the prior art. The two independent claims (claim 16 and claim 18 in the claims submitted 2/7/06) recite an information processing apparatus which Examiner did not find in the prior art. In particular, Examiner submits that while the three pertinent
5 references cited in the previous action (i.e. Heer, Imai, and Stokes) account for features of the information processing apparatus, the information processing apparatus described contains functionality not found in the cited references or the prior art as a whole. For example, Examiner finds no disclosure of a single semiconductor chip processing device which contains cryptographic functionality as claimed along with data protection functionality to delete first key information in volatile memory via power supply in response
10 to an abnormality AND which *"voids a control signal to said volatile memory until an internal logical block in said processing device is finished initializing"* (see claim 16 and substantially similar language in claim 18).

With regard to the italicized portion, Applicant has described that a gate fixedly nullifies all the signals to volatile memory until initialization of the internal logic block is completed with the main power
15 supply turned on. Further, Applicant teaches that even under condition that only the key custody area is supplied with power while the other circuits are not supplied with power, it is possible to eliminate an excess leakage current (Specification: page 23 bottom four lines to page 24, line 3). Examiner finds no disclosure of the italicized limitation in conjunction with the single semiconductor chip with cryptographic and data protection functionality as claimed. For at least this reason, Examiner believes the instant
20 claimed invention patentable over the prior art.
